

Pelleting poplar seeds – a chance to improve cultivation of seedlings?

Gisela Naujoks, Ute-Katrin Krakau
Thünen Institute for Forest Genetics

Outline

- **Introduction**
- **Material**
- **Methods**
 - pelleting process
 - germinations tests
 - sowing in the soil
 - storage experiments
- **Results**
 - in the lab
 - in the greenhouse and nursery
 - storage results
- **Conclusions**

Introduction

Specialty of aspen and their seeds

- pioneer tree species, suitable for poor and dry soil
- increasing demand for use in bioenergy plantations
- plenty of seed only every 3-5 years
- very small seeds, 1000 seed weight 35 – 133 mg
- without endosperm, surrounded by a thin translucent seed coat

Introduction

- only few weeks viable in a natural environment
- not dormant, may germinate within few hours with favourable conditions
- difficult harvesting, cleaning and sowing of seeds
- only one hint on former pelleting experiments

Aspensaat auf Sturmwurfflächen

Eine einfache und kostengünstige Möglichkeit zur schnellen Wiederbewaldung ?

als
Diplomarbeit der
Forstwissenschaftlichen Fakultät
der Albert-Ludwigs-Universität
vorgelegt von

Thomas Heindrichs

Freiburg, im April 1992

Material

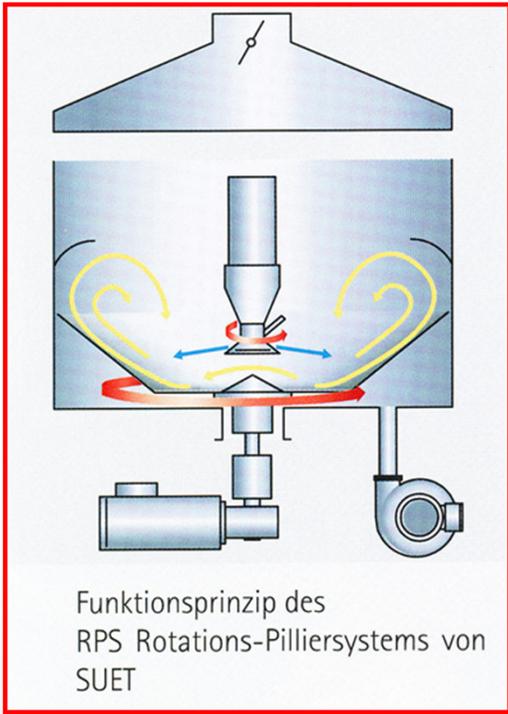

Seed supply for the project

Tree species	Origin	Year of harvest	Seed characteristics			
			weight (g)	water activity (aw)	moisture content (%)	germination (%)
<i>Populus tremula</i>	Bunk Pflanzen, Elmshorn	1990	17			56
		1993	152			86
		2004	30			74
<i>Populus tremula</i>	Waldsieversdorf	2010	75		7.0-7.39	91
		2011	126	0.381	5.62	70
<i>P. tremula x P. tremuloides</i>	Waldsieversdorf	2011	208	0.364-0.415	5.04-5.80	67-85
Hybrid poplar 'Rochester'	Waldsieversdorf	2011	53	0.468	6.35	86
		2012	2.113	0.527	7.58	80
Hybrid poplar 'Oxford'(?)	Waldsieversdorf	2011	644	0.498	6.05	88-91
<i>Populus nigra</i>	Semillas Montaraz,	2010	20			89
<i>Populus alba</i>	Spain	2010	20			83

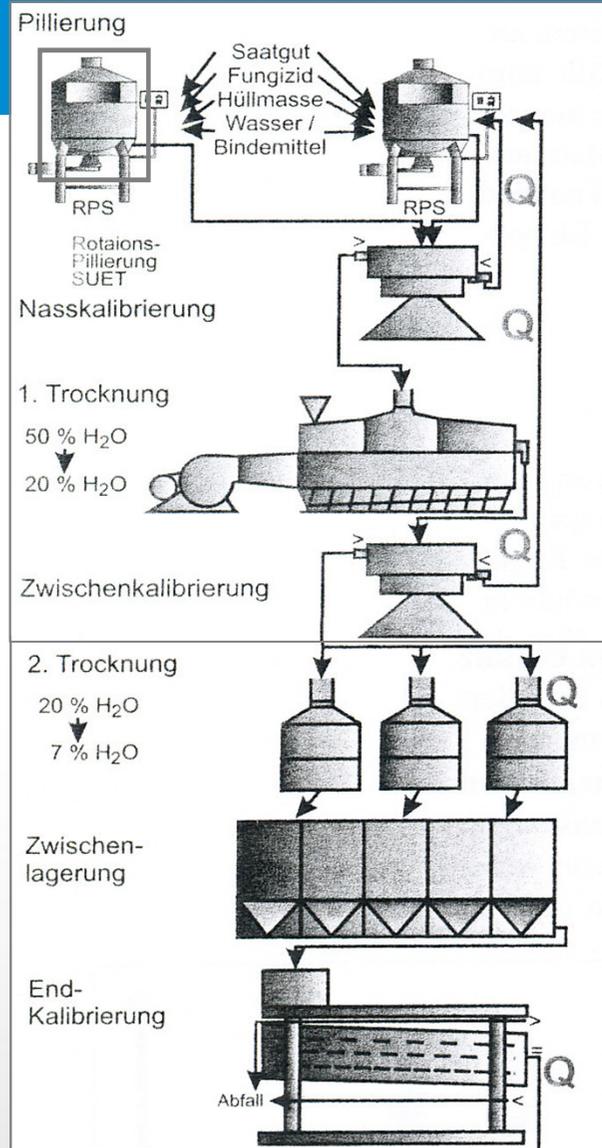

aw: Water activity, assessed with HygroPalm 23-Aw (rotronic GmbH)

Methods

Pelleting process

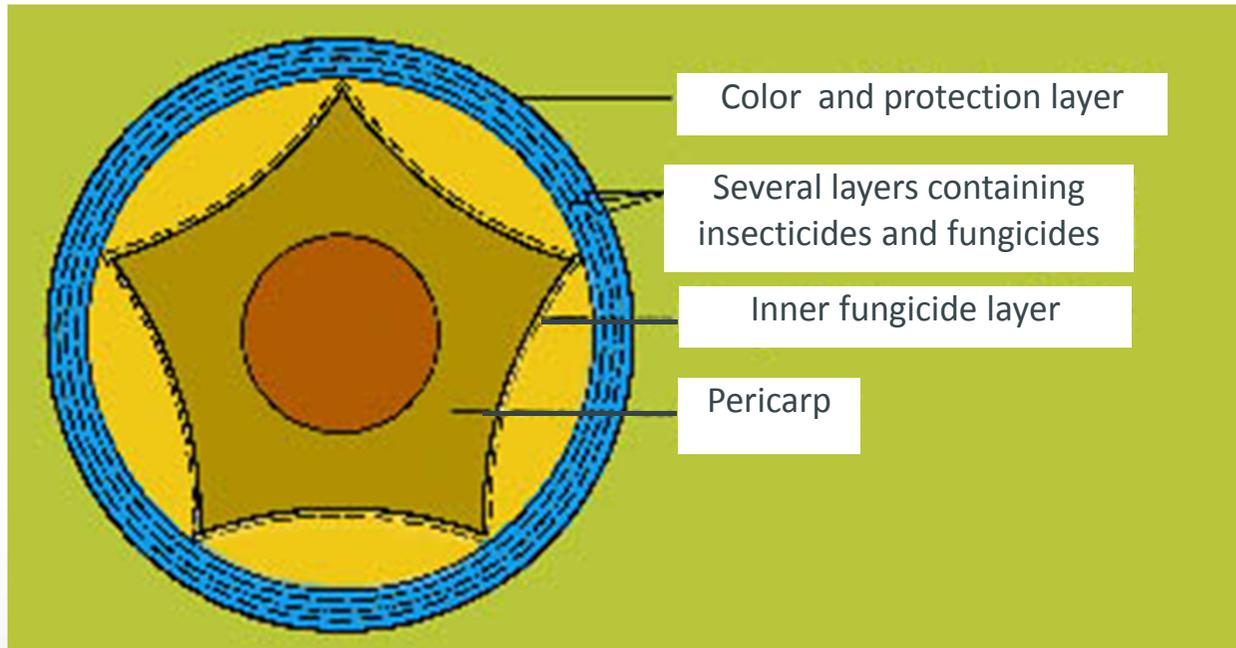

Example: Pelleting of sugar beet seed
 Cited from: Lamprecht, H.: Saatgutumhüllung,
 in Kruse, M. (2008): Handbuch Saatgutaufbereitung

Methods

Structure of a pelleted seed

Drawing modified from:

<http://www.suet.de/en/services/manufacture>

Methods

Germination test conditions

According to ISTA rules 20 / 30 °C (SUET lab); modified to 21 +/-2 °C (Thünen lab)
4 x 100 seeds, moist filter paper

Seedling evaluation related to good growth and well developed essential organs
e.g. elongated hypocotyle, well formed cotyledons, collet hairs, main root

abnormal seedlings

normal seedling

Methods

Sowing in the soil

SUET greenhouse:

2 x 100 seeds, commercial propagation soil
3 – 4 weeks

Thünen greenhouse:

2 x 104 seeds (HerkuPak HPD 104/5R) resp.
4 x 24 seeds (Quickpot 24)
Commercial propagation soil : sand = 1 : 1
8 – 19 weeks

Plants from sowing tests with pelleted aspen seeds in different container types

Evaluation of normal vs. abnormal growth, shoot length, shoot and root dry weight, shoot/root ratio, survival percentage

Methods

Storage experiments

Experiment No.	Seed + pelleting type	Temperatures	Germination test intervals
1	aspen 2010 / pelleting with 2 levels of firmness	room temperature (21 +/-2°C) fridge (6 +/-3°C) deep freezer (-11 +/-3°C) deep freezer (-20 +/-1°C)	14 days 4 weeks 6 months 1 year
2	hybrid aspen 2011 / pelleting with 2 levels of firmness	room temperature (21 +/-2°C) fridge (6 +/-3°C) deep freezer (-20 +/-1°C)	14 days 8 weeks 6 months
3	aspen, hybrid aspen, hybrid poplars 2011 firmness/bacteria/fungicide	fridge (6 +/-3°C) deep freezer (-20 +/-1°C)	12 weeks 6 months
4	hybrid aspen, hybrid poplar 2011 3 moisture levels	fridge (6 +/-3°C) deep freezer (-20 +/-1°C)	12 weeks 6 months

Results

56 samples were pelleted until now

3 firmness levels: standard (based on SUET know-how) = variant 7
more binding material = variant 8
much more binding material = variant 9

3 calibres in aspen: 1-1.25, 1.25-1.5 and 2-2.5 mm
1 calibre in the poplar species: 1-1.25 mm or 1.5-2 mm

Results

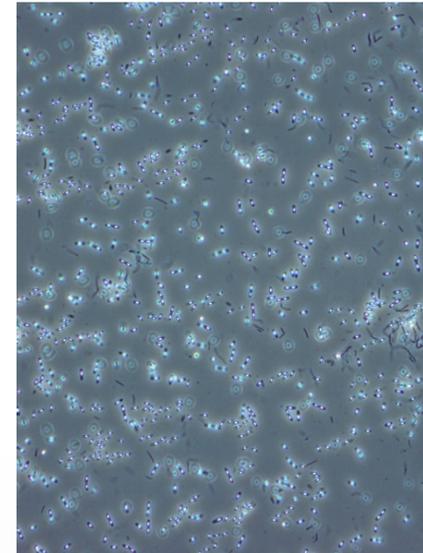

Addition of growth-promoting compounds

6 bacteria strains:

5 *Paenibacillus* strains (supplied by Dr. K. Ulrich, Thünen Institute)
Bacillus amyloliquefaciens („Rhizovital“ by ABiTEP GmbH)
Integration was successful, $10^4 - 10^7$ cfu/seed pellet

2 mycorrhiza products:

„Mykorrhiza soluble“ and „Mykorrhiza Samenimpfstoff“
(by Mushroom Research Centre MRCA GmbH, Austria)
problems due to limited technical miscibility

Spore suspension of
Paenibacillus humicus

(* , **: germination test with 100 resp. 200 seeds only)

Results

Effect of aspen seed pelleting on plant survival in the greenhouse

*: significant difference to the unpelleted control

Aspen: seed harvest 2011
Hybrid poplar: 'Rochester' 2012

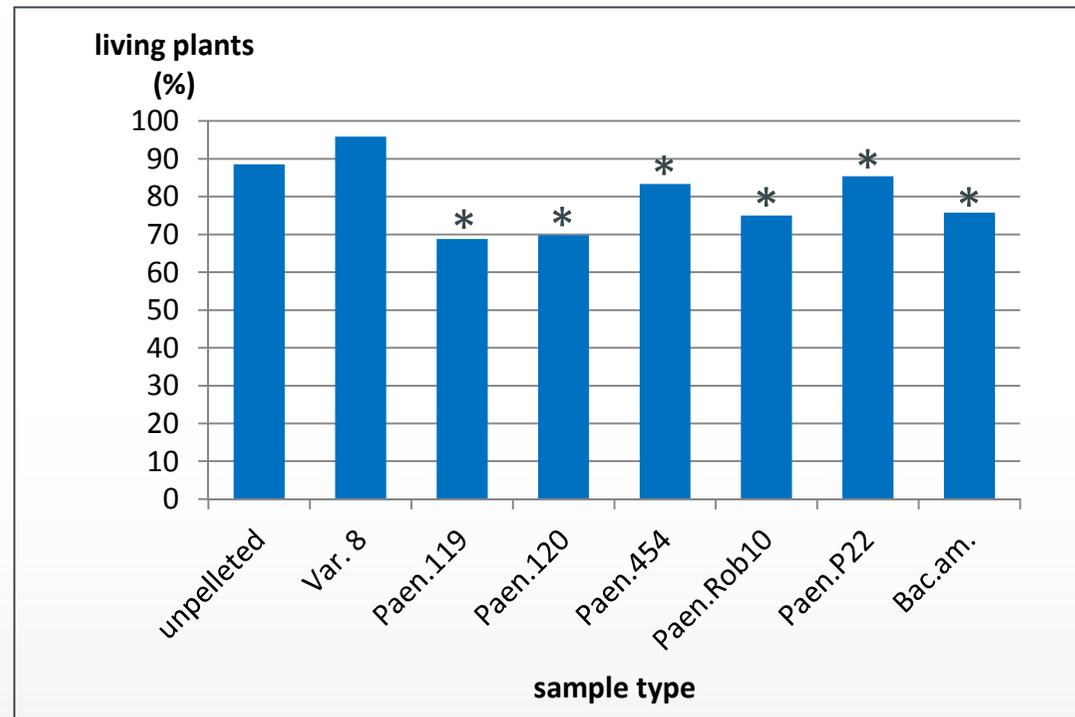

cultivation period 16 resp. 19 weeks
beginning in July resp. Sept. 2012

Results

Effect of aspen seed pelleting on plant survival in the greenhouse

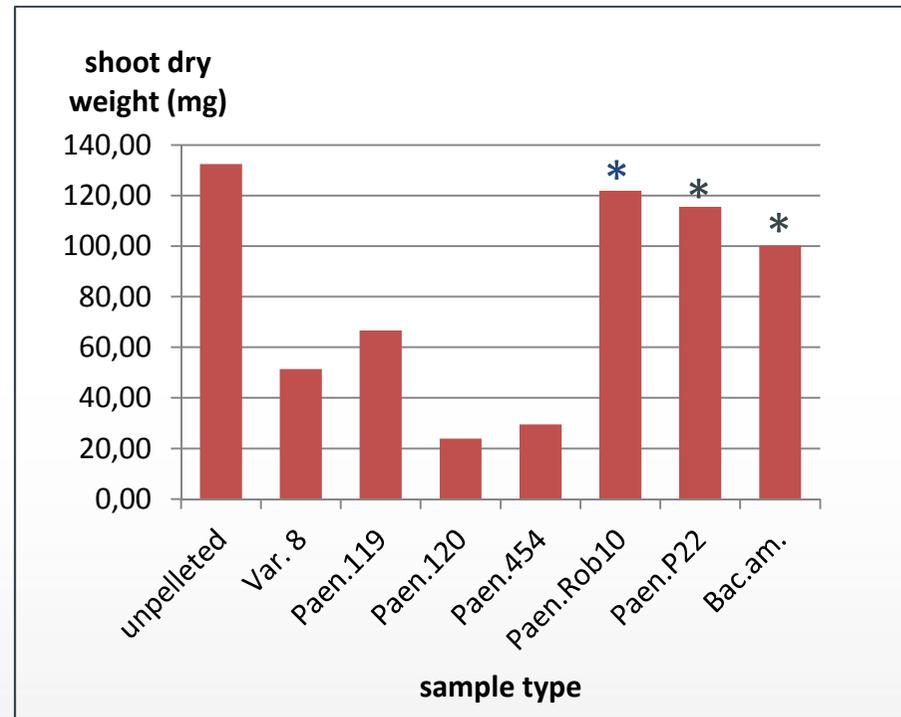

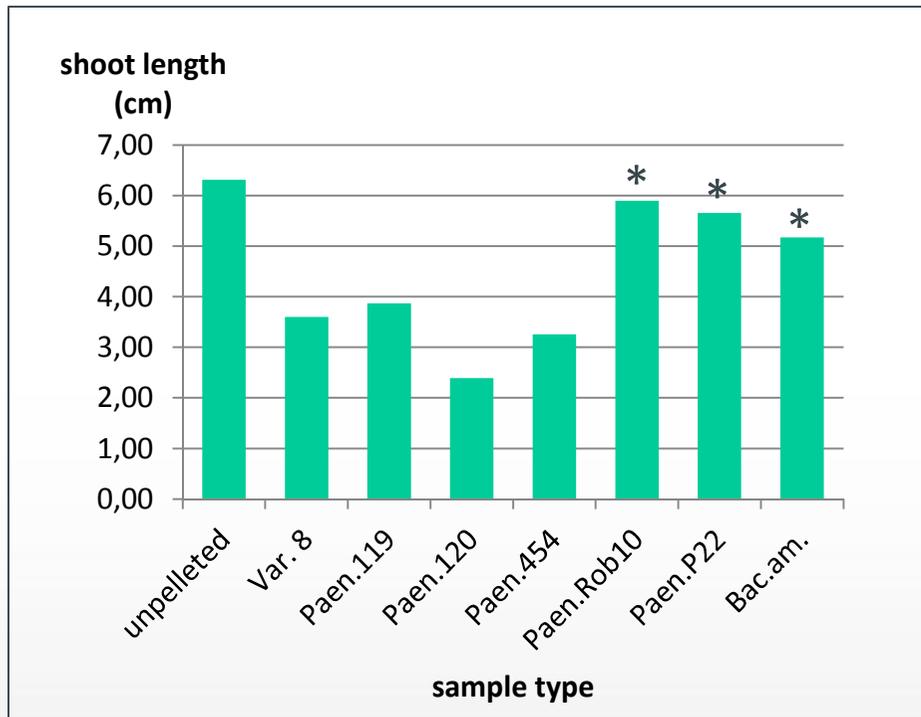

Aspen seeds: Bunk 1993,
all pelleted with var.8
cultivation period 15 weeks
beginning at October, 25th 2012

*: significant difference to var.8 without additives

Results

Effect of bacteria added to aspen seed pellets

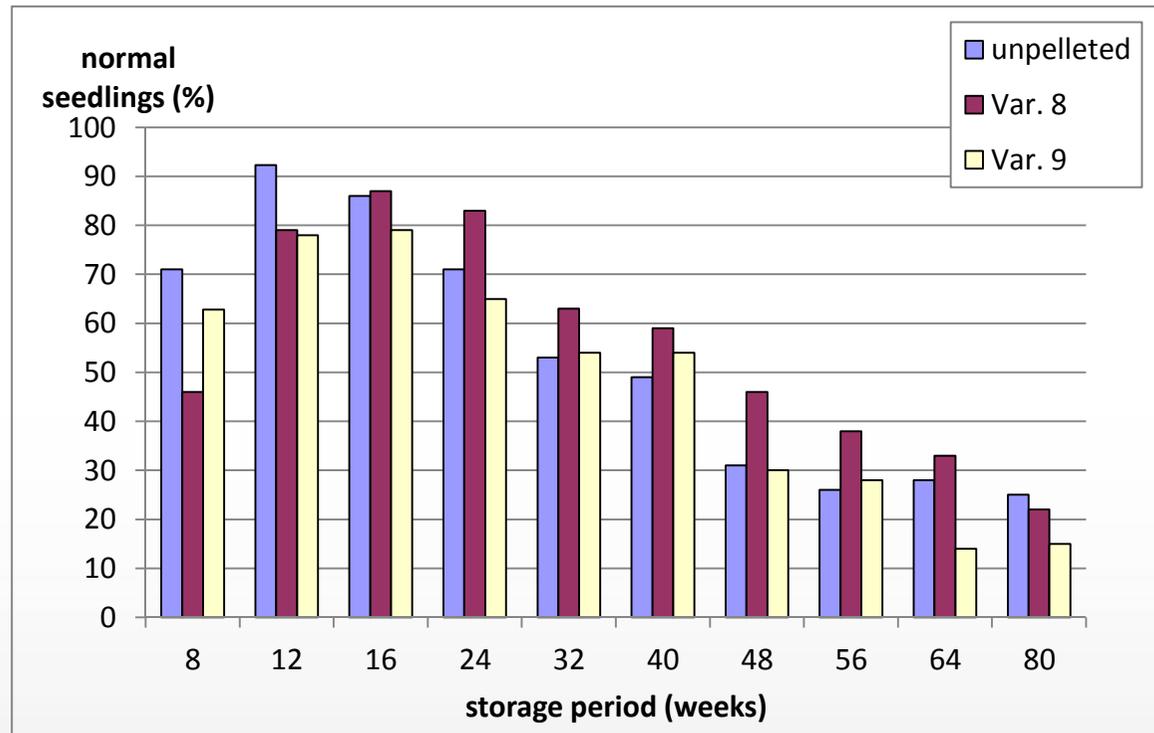

Aspen seeds: Bunk 1993, all pelleted with var.8
Cultivation period 15 weeks, beginning at October, 25th 2012
*: significant difference to var.8 without additives

Results

Storage of hybrid aspen in the fridge at + 6°C

Storage in sealed plastic bags,
one additional sample of each variant
with vacuum for a final control

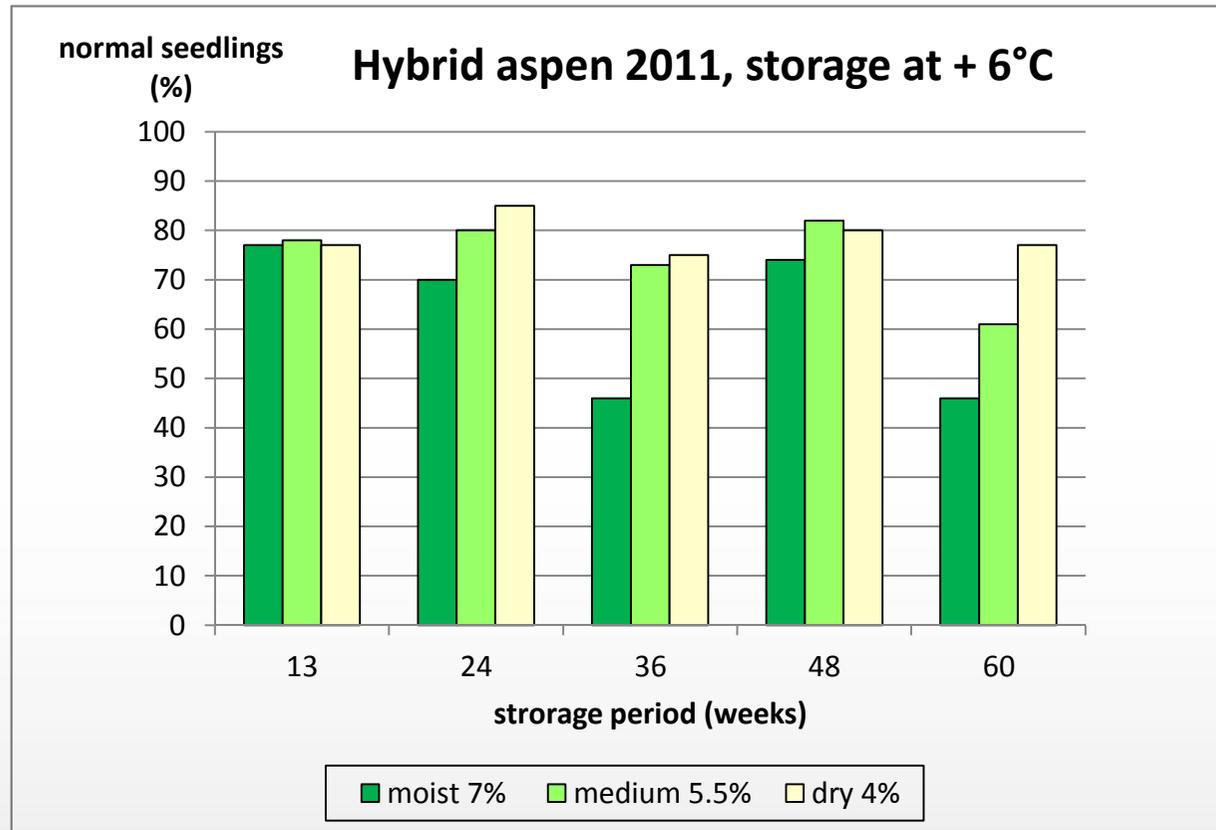

Results

Storage in the deep freezer at -20°C

Results

Storage experiment with different seed moisture

Results

Sowing suitability

First tests were made:

- Thünen Institute, Waldsiedersdorf (container; nursery bed)
- Thünen Institute, Großhansdorf (container)
- nursery of Bunk Pflanzen, Elmshorn (nursery bed)
- Agrimedia GmbH Gartenbaubedarf, Eisenberg (container sowing device „Lehners Sägerät“)

Positive response, but repetition of sowing tests is necessary.

Problems in the nursery with extreme weather conditions (e.g. strong rainfall) and weed control

Conclusions

- Pelleting of aspen and other poplar seeds results in improved suitability for sowing (higher seed weight and calibre)
- At the best, slight reduction of germination percentage is to be expected after pelleting aspen and other poplar seeds but, excellent seed quality is the pre-condition
- In some cases, reduced germination percentage of seed pellets is accompanied by increased shoot biomass development
- Growth enhancement after addition of *Paenibacillus* strains must be verified
- Mycorrhiza products integration into aspen seed pellets was not successful
- Pelleted seeds have the same suitability for storage like pure aspen seeds, provided the seed moisture content is optimal (5-6%, storage at -20°C) and seeds have a high quality

Special thanks to

- the Fachagentur Nachwachsende Rohstoffe e.V. for funding the research project „Pelleting of aspen seeds aimed at improvement of sowing technology and suitability for storage”
- Ute Strassburg-Käßler and Kevin Hahn for skillful technical assistance
- numerous members of the Thünen Institute for Forest Genetics for their support in peak periods, e.g. during seed harvest and cleaning
- D. Schneck and colleagues, Landesbetrieb Forst Brandenburg, Landesstelle für forstliches Vermehrungsgut for cooperation and technical aid
- Dr. K. Ulrich, ABiTEP GmbH and MRCA GmbH for supply of bacillus and mycorrhiza samples

Thank you for your attention!
